11 April 2023

PROSPECH IDENTIFIES HIGH-GRADE RARE EARTH OXIDES AND HAFNIUM OVER 4KM STRIKE AT JOKIKANGAS PROJECT, FINLAND

Highlights

- **Mineralisation database[1] at recently acquired Jokikangas project and surrounding Otanmaki area returns rare earth element oxide (REO) intercepts in diamond drill hole samples over a strike length of 4 kilometres.**

- **Results[2] include:**

  - **KA02: 0.20m @24,448 ppm TREO and 4,700 ppm Niobium from 74.2m**
  - **KA03: 0.15m @15,346 ppm TREO and 2,980 ppm Niobium from 9.2m**
  - **KA03: 0.17m @ 8,690 ppm TREO and 2,030 ppm Niobium from 57.3m**
  - **JO11: 0.20m @ 2,106 ppm TREO from 54.1m**
  - **JO12: 0.20m @ 1,704 ppm TREO from 26.9m**
  - **JO12: 0.40m @ 4,509 ppm TREO from 42.2m**
  - **JO13: 0.50m @ 7,556 ppm TREO and 940 ppm Hafnium from 22.6m**
  - **JO13: 0.30m @10,445 ppm TREO and 1,160 ppm Hafnium from 32.8m**
  - **KO06: 0.40m @ 2,865 ppm TREO and 510 ppm Hafnium from 85.6m**

- **Drill core sampling was limited to narrow intervals for academic purposes, resulting in only narrow intersection intervals reported.**

- **Prospech has commenced sampling wider intervals of the Jokikangas drill core.**

- **Drill core is available from 36 diamond drill holes at Jokikangas and 68 diamond drill holes at Korsnas.**

- **Prospech has applied to expand the Jokikangas project to cover open ground with reported vanadium mineralisation.**

---

[1] Age and Origin of the Nb Zr Ree Mineralisation in the Paleoproterozioc granitoids at Otanmaki, Central Finland. Bulletin of the Geological Society of Finland. Volume 92, 2020.

[2] All values reported in Total Rare Earth Oxide (TREO) amounts unless otherwise stated.

Prospech Managing Director Jason Beckton commented: *"We are delighted to reveal results from our archive search and compilation of historical drill core at Jokikangas as the new Bambra Oy assets are incorporated into our portfolio.*

According to Oulo University and Geological Survey of Finland, the peralkaline alkali feldspar granites are the most probable source for the Rare Earth Element (REE) and High Field Strength Element (HFSE) mineralised felsic dikes and sheet-like intrusions. Magnetic anomalies within the "enriched" alkali feldspar granite block and its surroundings, as well as the contact areas of this block against the monzogranite block, offer interesting potential for REE-HFSE mineralisation.

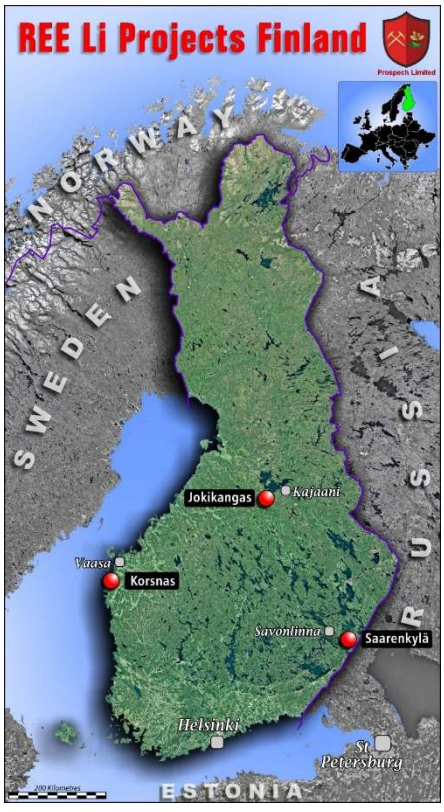
High Field Strength Elements which include Niobium and Hafnium are characterised by their ability to form strong bonds with other atoms, due to their electronic structure. This property makes them useful in a variety of technological applications where strength, durability and resistance to corrosion are required.

There is a significant increase in demand for locally supplied critical minerals in Europe and the government is strongly committed to fulfilling as much of the demand as possible from local sources.

The brownfield targets of Jokikangas, Korsnas, and Saarenkylä in Finland, which have been explored since 2018, provide us with an exciting opportunity to enter the REE and lithium space in the EU and we are planning to accelerate our exploration on the back of these results."

About Finland and the Finland Projects

Finland is recognised as a favourable mining jurisdiction within the European Union and has been ranked ninth globally in the 2021 Fraser Institute Annual Survey of Mining Companies' Policy Perception Index and 13th in the Investment Attractiveness Index, surpassing jurisdictions such as Queensland, NSW, and Victoria.



Location map of the Bambra projects in Finland

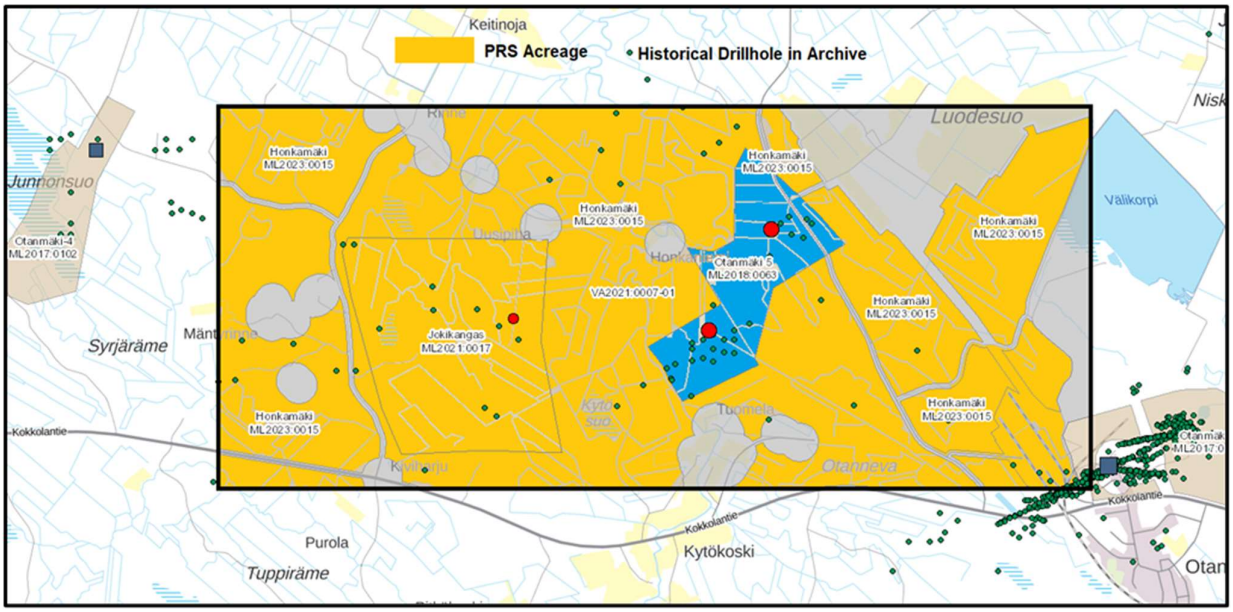
Prospech's geological team has prior experience working in Finland, and the acquisition of Bambra will provide a local permitting and administration team with extensive country experience.

Project summaries

Extensive mapping and sampling of the mineralised horizons was conducted by the Geological Survey of Finland (GTK), and Prospech aims to prioritise the grade and tonnage potential of each occurrence to plan and permit drilling in the near future.

Jokikangas REE Project

Jokikangas REE project encompasses two blocks, Jokikangas and Honkamäki, covering a total area of 28.37km^2, while the third-party Otanmaki (05) Oy tenure is indicated by the blue area in the map bello. Jokikangas and Honkamäki cover a REE-vanadium mineralised belt of rocks.



Jokikangas tenements

Elongated bodies containing up to 2.0% TREE are characterised by sericitic alteration and a spatial relationship with pegmatites in a mineral assemblage that includes fergusonite (Nb, Y, REO), allanite (LREE), and columbite-tantalite (Nb).

Prospech holds rights to exploration tenure surrounding the Kontioaho and Katajakangas targets currently held by Otanmaki (O5) Oy, with mineralisation that is continuous but lightly drilled. The mineralisation at Katajakangas features a high-grade zone approximately 12m thick in its central part, surrounded by a lower-grade zone at the margins.

Archived drillhole data indicates an opportunity to extend mineralisation northwest of Otanmaki (05) Oy's Kontioaho operation and west of the Katajakangas operation (both depicted as red dots on the Otanmaki (05) Oy map above) onto the Jokikangas project.

Korsnas REE Project

The Korsnas REE project surrounds a former lead mine at Korsnas, which operated from 1959 to 1972 and produced 0.87Mt of ore with an average of 3.6% Pb. The deposit was found to be prospective for REE due to the presence of allanite and a few other REE minerals.

During pilot production of an REE concentrate in the early 1970s, it was discovered that the ore contained 0.83% TREO. The mineralisation is situated in a fault zone that trends north-south and is filled with a vein consisting of coarse-grained calcite, feldspar, diopside and REE-bearing apatite.

Previous mine operators have reported total REE content of samples ranging from 0.7% to 2.2%, with LREE being the dominant component. The samples also exhibit high europium (Eu) content, with values ranging from 66 to 242 ppm and thorium (Th) content ranging from 107 to 604 ppm.

There is core from 68 government stored drillholes from the immediate vicinity of the Korsnas mine that remain unsampled and there is also a group of unmined carbonate veins or dykes that up to 20m wide that may contain REE grades.

Saarenkylä Lithium-Berrylium Project

The Saarenkylä exploration reservation area is situated in a region with a known occurrence of lithium pegmatite, where lithium-cesium-tantalum (+/- beryllium) has been observed in exposed sequences of pegmatite.

The area is located within the Northern Ladoga belt, which is known for various minerals such as Sn, Zn, Pb, U, Au, W, Fe, and V. A mineral occurrence has been identified in pyroxene skarn with potential associations of nearby mineralisation within the Myerskaja Fault zone.

The mineralisation at this location includes occurrences of beryl, bismuthinite (Bi), scheelite (W), cassiterite (Sn), and native gold, which are conformable. Field mapping and sampling will be required to determine the continuity of the occurrence.

Prospech has filed a new reservation notification with the Finnish Mining Authority to extend the project area over the known lithium pegmatite occurrence area.

For further information, please contact.

Competent Person's Statement

The information in this Report that relates to Exploration Results is based on information compiled by Mr Jason Beckton, who is a Member of the Australian Institute of Geoscientists. Mr Beckton, who is Managing Director of the Company, has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Beckton consents to the inclusion in this Report of the matters based on the information in the form and context in which it appears.

This announcement has been authorised for release to the market by the Managing Director

JORC Code, 2012 Edition – Table 1 Schopfer, Hodrusa

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	*Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* *Aspects of the determination of mineralisation that are Material to the Public Report.* *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	N/A
Drilling techniques	*Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	Assumed Diamond HQ, NQ and BQ drilling.
Drill sample recovery	*Method of recording and assessing core and chip sample recoveries and results assessed.* *Measures taken to maximise sample recovery and ensure representative nature of the samples.* *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	Historic Core N/A.
Logging	*Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* *The total length and percentage of the relevant intersections logged.*	The complete core is to be relogged.
Sub-sampling techniques and sample preparation	*If core, whether cut or sawn and whether quarter, half or all core taken.* *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* *Whether sample sizes are appropriate to the grain size of the material being sampled.*	N/A.
Quality of assay data and laboratory tests	*The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory*	Samples are stored in the Loppi relogging facility.

Criteria	JORC Code explanation	Commentary
	checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	
Verification of sampling and assaying	*The verification of significant intersections by either independent or alternative company personnel.* *The use of twinned holes.* *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* *Discuss any adjustment to assay data.*	N/A.
Location of data points	*Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* *Specification of the grid system used.* *Quality and adequacy of topographic control.*	UTM projection Zone 35N.
Data spacing and distribution	*Data spacing for reporting of Exploration Results.* *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* *Whether sample compositing has been applied.*	Subsampling below 0.2m was undertaken by previous companies.
Orientation of data in relation to geological structure	*Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	No bias is believed to be introduced by the sampling method.
Sample security	*The measures taken to ensure sample security.*	N/A
Audits or reviews	*The results of any audits or reviews of sampling techniques and data.*	No audits or reviews of the data management system have been carried out.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	*Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* *The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.*	Prospech Limited has entered into an earn-in agreement with the shareholders of Bambra Oy ('Bambra'), a company incorporated in Finland, to earn up to a 100% interest in Bambra and therefore, acquire Bambra's 100% interest in the Jokikangas REE project, the Korsnas REE project and Saarenkylä lithium project in Finland ('Finland Projects'). Prospech's exclusive right to acquire 100% of Bambra is staged over 2 years with consideration being an initial payment of $25,000 ('Exclusivity Payment'), a series of exploration and evaluation expenditures and the issuance of Prospech consideration shares. For the first year option, Prospech can earn a 51% interest in Bambra by the expenditure of $100,000, including the Exclusivity Payment, on the exploration and evaluation of the Finland Projects and, if exercised by Prospech, the issue of 3 million fully paid ordinary shares in Prospech to the shareholders of Bambra ('First Option'). For the second year option, subject to the completion of the First Option, Prospech can earn the remaining interest in Bambra, so as to own 100% of Bambra, by the expenditure of $200,000 on the exploration and evaluation of the Finland Projects and, if exercised by Prospech, the issue of a further 3 million shares to the shareholders of Bambra. The laws of Finland relating to exploration and mining have various requirements. As the exploration advances specific filings and environmental or other studies may be required. There are ongoing requirements under Finnish mining laws that will be required at each stage of advancement. Those filings and studies are maintained and updated as required by Prospech's environmental and permit advisors specifically engaged for such purposes. The Company is the manager of operations in accordance with generally accepted mining industry standards and practices.

Criteria	JORC Code explanation	Commentary
Exploration done by other parties	*Acknowledgment and appraisal of exploration by other parties.*	The area of Otanmaki – Jokikangas has been mapped, boulder sampled and drilled by private companies including Rautaruuki Oy and Outokumpu Oy from 1981. In 2020 the project was subject to core resampling by GTk (Finnish Geological Survey) and University of Oulo, utilising ALS Chemex Laboratory in Outokumpu, Finland. Karenlampi et al 2020.
Geology	*Deposit type, geological setting and style of mineralisation.*	The Otanmäki rare earth element (REE) area is composed of diverse rock types such as granite gneisses, granites, alkali gneisses, quartz-feldspar schists, amphibolites, and mica schists. The formation of REE-bearing minerals in this area is associated with hydrothermal alteration of the host rocks caused by the intrusion of gabbros and anorthosites in the Otanmäki region.
Drill hole Information	*A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* *easting and northing of the drill hole collar* *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* *dip and azimuth of the hole* *down hole length and interception depth* *hole length.* *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	Drill Hole Collar Information (All UTM Zone 35N) Assay results, refer below to Appendix 1.
Data aggregation methods	*In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually* *Material and should be stated.* *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	A minimum sample length is 0.4m generally but can be as low as 0.15m is observed in historical sampling.
Relationship between mineralisation widths and intercept lengths	*These relationships are particularly important in the reporting of Exploration Results.* *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	Mineralisation is mesothermal contact related between intrusives of Paleoproterozoic age.
Diagrams	*Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	The location and results received for some drill-core samples are displayed in the attached maps and/or tables. Coordinates are UTM Zone 35N.
Balanced reporting	*Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	Results for all samples collected in the past are displayed on the attached maps and/or tables.

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	*Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	No metallurgical or bulk density tests were conducted at the project by Prospech.
Further work	*The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	Prospech may carry out drilling subject to resampling of these intervals in late April 2023.

Section 1 Appendix – Assays of Rare Earth Oxides to date collated from historic drilling.

To be resampled at Loppi GTK facility
